Q1: What is the purpose of the 'final' keyword in Java?

A: The 'final' keyword is used to declare constants, prevent method overriding, and prevent inheritance of a class.

Q2: What are checked and unchecked exceptions in Java?

A: Checked exceptions are exceptions that must be handled at compile time (e.g., IOException), while unchecked exceptions are runtime exceptions (e.g., NullPointerException).

Q3: What is the difference between an abstract class and an interface?

A: An abstract class can have both abstract and non-abstract methods, while an interface only contains abstract methods (prior to Java 8).

Q4: Explain method overloading and method overriding.

A: Method overloading allows multiple methods with the same name but different parameters, while method overriding allows a subclass to provide a specific implementation of a method from its superclass.

Q5: What is the significance of the 'static' keyword in Java?

A: The 'static' keyword allows a variable, method, or block to belong to the class rather than instances of the class. Static methods can be called without creating an object.
